SLICER COMBINATIONS

SLICER × SLICER COMBINATION ANALYSIS

GENDER	TENURE GROUP	INTERNET SERVICE	CHURN BEHAVIOR	RISK LEVEL	KEY DRIVER
Female	0–12 months	Fiber Optic	Highest churn segment — new female Fiber Optic users drop off before month 12	Critical	Short tenure + premium service mismatch
Male	0–12 months	Fiber Optic	Nearly identical pattern to female counterpart — new male customers also churn heavily	Critical	Onboarding failure + price shock
Female	0–12 months	DSL	Moderate churn — lower than Fiber, but still elevated in early months	High	Early dissatisfaction, switching to Fiber
Male	0–12 months	DSL	Similar moderate churn to female DSL new customers	High	Speed expectations not met
Female	13–24 months	Fiber Optic	Churn drops ~30% vs 0–12 group — loyalty begins forming but still vulnerable	Medium	Lack of contract lock-in
Male	13–24 months	Fiber Optic	Slight improvement from early tenure — payment method matters more here	Medium	Electronic check payers more likely to churn
Female	25–48 months	Fiber Optic	Churn stabilizes — customers with 2–4 years are invested in service	Low-Med	Service count increases loyalty
Male	25–48 months	DSL	Among lowest churn combinations — older DSL users are very sticky	Low	Long-term habituation, bundled services
Female	48+ months	Any	Loyal base — churn rate drops below 10% regardless of internet type	Very Low	Tenure is the strongest retention factor

GENDER	TENURE GROUP	INTERNET SERVICE	CHURN BEHAVIOR	RISK LEVEL	KEY DRIVER
Male	48+ months	Any	Mirrors female long-tenure — gender not a differentiator at this stage	● Very Low	Contract type locks in loyalty
Any	Any	No Internet	Consistently lowest churn across all gender × tenure combos — ~8% churn	● Lowest	Voice-only customers have few switching options
Female	0–12 months	No Internet	Near-zero churn — new female voice-only users are very stable	● Very Low	Low cost, limited alternatives

💡 CORE DASHBOARD INSIGHTS (BY VISUAL)

CONTRACT TYPE = #1 CHURN DRIVER

Slicer: All Combinations

Month-to-Month contract customers churn at **~42–45%**, compared to just **~11%** for one-year and **~3%** for two-year contract holders. This gap persists across all gender and tenure slicer combinations, making it the single most powerful predictor of churn in the dataset.

Two Year

ELECTRONIC CHECK = HIGHEST PAYMENT CHURN

Slicer: Gender + Tenure Group

Electronic check payers churn at nearly **2× the rate** of auto-pay customers. When filtering for Female + 0–12 months on the slicers, this gap widens further. Customers on bank transfer or credit card auto-pay show far greater retention, suggesting friction in payment experience correlates with dissatisfaction.

Auto-Pay Methods

FIBER OPTIC = PARADOX OF QUALITY

Slicer: Internet Service

Despite being the premium tier, **Fiber Optic customers churn most** (~41% churn rate), compared to DSL (~19%) and No Internet (~7%). Across all Gender × Tenure slicer combos, Fiber Optic segments consistently show elevated churn — indicating a price-value gap or unmet speed expectations driving defection.

TENURE IS THE STRONGEST RETENTION SHIELD

Slicer: Tenure Group

Churn drops dramatically after the first year. Customers in the **0–12 month** tenure group churn at ~48%, while **48+ month** customers churn at under 10%. The first 12 months are the make-or-break window. When combined with Internet Service slicer, Fiber Optic new customers (0–12 months) represent the most urgent retention priority.

SENIOR CITIZENS CHURN AT 2× THE RATE

Slicer: Gender + Internet Service

MORE SERVICES = LESS CHURN

Slicer: All 3 Combined

Senior citizens show a churn rate of approximately **41%** versus ~23% for non-seniors. When the Internet Service slicer is set to Fiber Optic, senior churn likely exceeds 50%. This demographic likely faces UI/UX friction, pricing sensitivity, and fewer bundled service subscriptions reducing their switching cost.

~41%

Senior Citizens

~23%

Non-Seniors

The Service Count chart shows a clear inverse relationship: customers with **5+ active services** churn at a fraction of single-service customers. When filtering for Fiber Optic + Female + 0–12 months, multi-service bundles cut churn risk significantly. Cross-selling is one of the most cost-effective retention tools available.

GENDER IS NOT A SIGNIFICANT DIFFERENTIATOR

Slicer: Gender

The Churn% by Gender donut chart shows near-parity — Male (~26%) vs Female (~27%) churn. Toggling the gender slicer alone produces minimal change across all other charts. Gender should be used as a segmentation *modifier*, not a primary filter. Resources should instead focus on contract type, tenure, and internet service.

~27%

Female Churn

~26%

Male Churn

HIGH MONTHLY CHARGES = HIGHER CHURN RISK

Slicer: Internet Service + Tenure

The Monthly Charges Group bar chart reveals that customers in the **\$65–\$105+ range** churn at significantly higher rates. When Internet Service = Fiber Optic and Tenure = 0–12 months are both selected, this high-bill, new-customer segment becomes the most vulnerable cohort in the entire dataset.

STRATEGIC RECOMMENDATIONS

1

Launch a 90-Day New Customer Program

Target Fiber Optic + 0–12 month segment with proactive check-ins, discounts, or loyalty rewards. This is the highest-churn cohort across all slicer combinations.

2

Incentivize Contract Upgrades

Offer Month-to-Month customers a discounted annual plan. Moving even 20% to one-year contracts could reduce overall churn rate by 6–8 percentage points.

3

Auto-Pay Migration Campaign

Electronic check customers churn at ~2× the rate of auto-pay users. A small incentive (billing credit) to switch to bank transfer or credit card auto-pay can significantly reduce churn.

4

Senior Citizen Retention Package

Design a simplified, lower-cost plan for seniors. Their 41% churn rate suggests the current offering doesn't match their needs or budget.

5

Investigate Fiber Optic Value Gap

Fiber Optic should be the stickiest product, yet it churns the most. Survey Fiber churners — if it's a price issue, bundle deals; if speed/reliability, escalate to ops.

6

Cross-Sell to Single-Service Customers

Customers with 1–2 services are high churn risk. A targeted upsell campaign to add streaming, security, or tech support can build stickiness and reduce churn organically.
